

ABSTRACT OF THE DISCLOSURE

A lower portion of a nozzle is held hermetically in contact with an inner circumferential surface of the tubular neck of a container, and an inner surface of a cap is mounted to an outer surface of the tubular neck. A discharging hole of the nozzle is hermetically sealed by an inner top surface of the cap. A ring-shaped projection is formed on an upper portion of the nozzle for hermetically contacting an inner surface of the cap. Thereby, double sealing is provided in cooperation with hermetic sealing of the discharging hole of the nozzle by the inner top surface of the cap. The nozzle prevents a liquid leak and liquid dripping from the nozzle and form liquid drops independently of a dripping angle.
